

Introduction to Apache Calcite:
working with data from any data
source using SQL interface

Data sources

Introduction to Apache Calcite

Simplify writing of DBMS

Create a DBMS by composing

Advance the state of the art by pooling resources

Introduction to Apache Calcite

Connect datasource to Calcite

```
"schemas": [ {  
  "name": "CSV",  
  "type": "custom",  
  "factory": "org.apache.calcite.adapter.csv.CsvSchemaFactory",  
  "operand": {  
    "directory": "csv_files"  
  }  
}]
```

Connect datasource to Calcite

```
"name": "POSTGRESQL",  
"type": "custom",  
"factory": "org.apache.calcite.adapter.jdbc.JdbcSchema$Factory",  
"operand": {  
  "jdbcDriver": "org.postgresql.Driver",  
  "jdbcUrl": "jdbc:postgresql://localhost:5432/postgres?...",  
  "jdbcUser": "postgres",  
  "jdbcPassword": "postgres"  
}
```

Connect datasource to Calcite

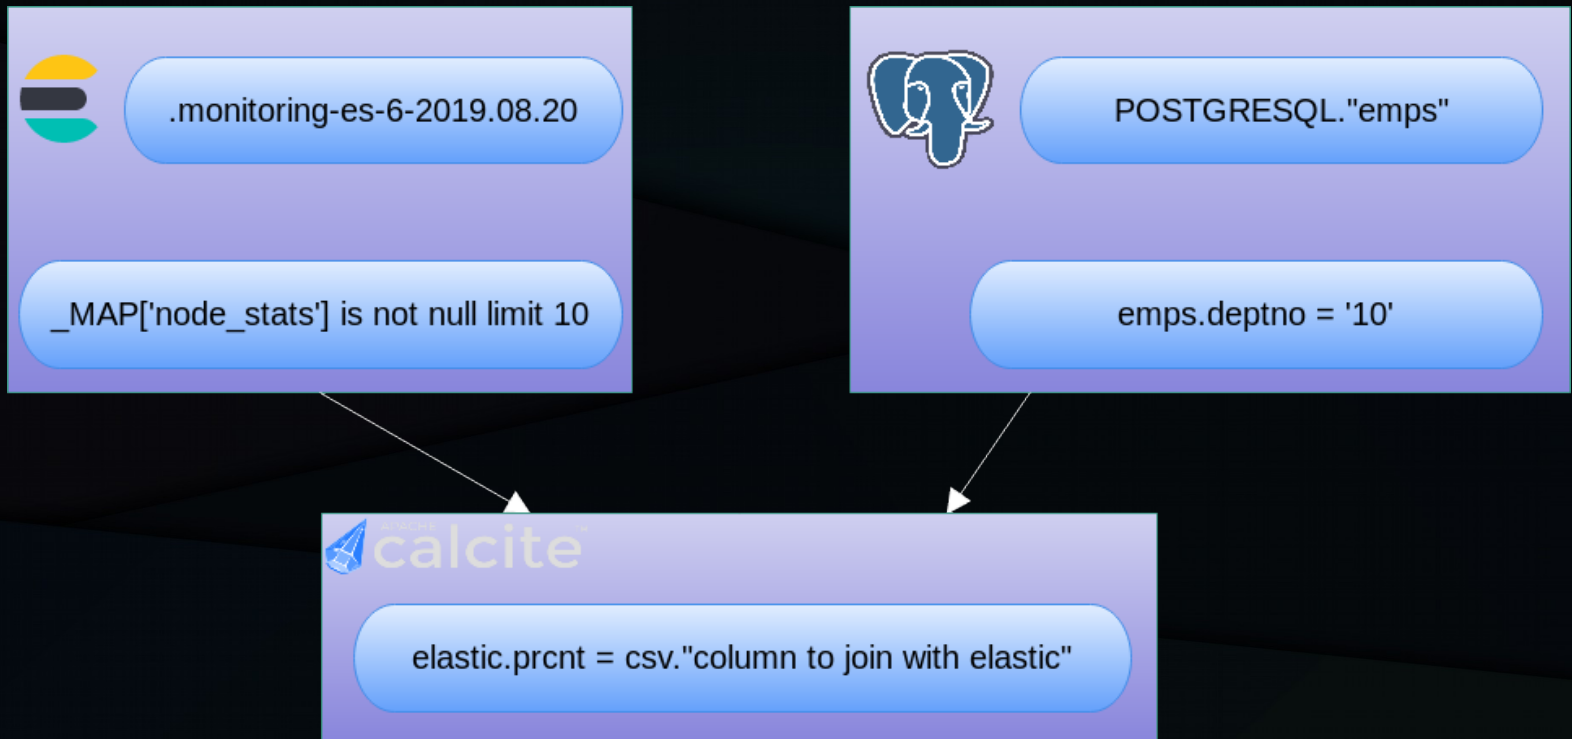

```
"type": "custom",  
"name": "ELASTIC",  
"factory": "org.apache.calcite...ElasticsearchSchemaFactory",  
"operand": {  
  "coordinates": "{ '127.0.0.1': 9200 }",  
  "index": ".monitoring-es-6-2019.08.20"  
}
```

DEMO time

The background features a dark blue gradient with several overlapping, semi-transparent black geometric shapes, primarily triangles and quadrilaterals, creating a layered effect. Thin white lines are present: a horizontal line near the top, a vertical line on the right side, and another horizontal line near the bottom, all intersecting to form a grid-like structure.

Use power of datasources
